

Ledger Scrolls puts files **inside the Cardano blockchain** — not a link, not a hash of a file kept somewhere else; the actual bytes, in transactions, replicated by thousands of independent nodes. Once written, a scroll **cannot be edited, cannot be deleted, and is timestamped** by the block that sealed it. Anyone can read it, free, forever. It costs a few dollars — **once**. No subscription, no pinning service, no custodian.

HOW IT WORKS

A **pointer** (one transaction id) leads to a **manifest** locked in an unspendable UTxO — an always-fail script address every node carries forever. The manifest declares the content type, lists the exact transactions holding the file's pages, and commits to the SHA-256 of the finished file. A reader fetches, reassembles, and **proves** the bytes before showing them. The golden rule: **a viewer never shows you bytes it could not verify**.

THE FORMATS

FORMAT	HOW THE BYTES LIVE	USE FOR
Standard Scroll	Whole file in one locked UTxO datum	Small treasures ≤ ~14 KB — messages, poems, icons
Chain Scroll	File split across plain tx metadata (label 22025), anchored by a manifest	Everything else — books, images, PDF, audio, video. ≈ 0.07 ADA/KB all-in, once
Publisher channel	A minting policy as a permanent byline	Serialized publishing only one key can sign — no platform can suspend or impersonate it

VERIFY WITH YOUR OWN HANDS

The whole protocol is two public queries and arithmetic — free, keyless, ~30 lines in any language:

```
# 1 – the manifest (type, hashes, page list):
curl -X POST https://api.koios.rest/api/v1/utxo_info \
  -d '{"_utxo_refs":["<manifest-tx>#0"],"_extended":true}' -H 'Content-Type: application/json'
# 2 – the pages it names (label 22025 holds the payload):
curl -X POST https://api.koios.rest/api/v1/tx_metadata \
  -d '{"_tx_hashes":["<page-tx-1>","..."]}' -H 'Content-Type: application/json'
# concatenate segments → gunzip → sha256sum – must equal the manifest's hash
```

ALREADY LIVE ON MAINNET

- The complete Bible (4.7 MB, 237 pages) · both Cardano Constitutions · the Bitcoin whitepaper · a full video
- **The Reader** — a working reader app, minted as a scroll: it can rebuild *itself* from the chain it reads
- **The Spec** — this wire format, stored in its own format
- **BEACN Leaks** — a whistleblower channel under an unforgeable byline

THE FIVE RULES

- **Permanent means permanent.** No edit, no delete — never inscribe secrets.
- **Rehearse on testnet.** Same bytes, free mistakes.
- **Hash before, verify after.** Reconstruct from chain before announcing.
- **Keep receipts.** Tx hashes are how civilization finds it again.
- **Self-contained files only.** Anything that phones home is a broken promise.
